Gains from Trade “Inside the Firm”

“The idea that ***international trade increases competition*** *goes back to Adam Smith, and is one of the reasons why economists believe that the* ***gains from trade and the costs from protection are larger than what their own models suggest****.”* —Helpman and Krugman (1989)

Gains from Trade “Inside the Firm”

> *“The idea that **international trade increases competition** goes back to Adam Smith, and is one of the reasons why economists believe that the **gains from trade and the costs from protection are larger than what their own models suggest**.”* —Helpman and Krugman (1989)

Great progress has been made in our understanding of trade ↔ competition ↔ productivity

- Selection: competition drives out laggard firms (Melitz, 2003)

Gains from Trade "Inside the Firm"

> *"The idea that **international trade increases competition** goes back to Adam Smith, and is one of the reasons why economists believe that the **gains from trade and the costs from protection are larger than what their own models suggest**."* —Helpman and Krugman (1989)

Great progress has been made in our understanding of trade ↔ competition ↔ productivity

- Selection: competition drives out laggard firms (Melitz, 2003)
- Within-firm "Slack" or "X-inefficiency"
  - *"Absent competitive pressure, firms may not use their resources efficiently"* (Leibenstein, 1966)
- **This paper:** competition compels firms to improve management quality and firm organization
  $\longrightarrow$ accompanied by within-firm productivity growth
- In today's global context, understanding how trade shapes organizations is increasingly urgent

Management Quality and Firm Organization: The House of Georges

- Why do firms organize this way?
  - Owners derive non-monetary private benefits from family management (Demsetz and Lehn, 1985)
- Trade and competition can be a powerful force that motivates such firms to professionalize
  - Competition eliminates the luxury of prioritizing non-monetary private benefits over monetary gains from firm efficiency
  - These organizational changes occur without deeper cultural or institutional shifts

Foreign Competition Induces Family Firms to Professionalize

1. **First-time access to confidential admin data** on 6M company executives in India

2. **Natural Experiment:** large, product-specific import competition shock → event-study design

3. **Quantitative Framework:** How much does the within-firm response matter in the aggregate?

Foreign Competition Induces Family Firms to Professionalize

1. **First-time access to confidential admin data** on 6M company executives in India
   - Family ties and tenure histories of executives and directors
   - Identify family-managed firms: the predominant organizational form in developing countries
     (La Porta et al., 1999; Bertrand & Schoar, 2006)

2. **Natural Experiment:** large, product-specific import competition shock → event-study design

3. **Quantitative Framework:** How much does the within-firm response matter in the aggregate?

Foreign Competition Induces Family Firms to Professionalize

1. **First-time access to confidential admin data** on 6M company executives in India
   - Family ties and tenure histories of executives and directors
   - Identify family-managed firms: the predominant organizational form in developing countries
     (La Porta et al., 1999; Bertrand & Schoar, 2006)

2. **Natural Experiment:** large, product-specific import competition shock → event-study design
   a. Firms contract: 28% ↓ in firm revenues
   b. Family firms professionalize management: 15% ↓ share of family executives on the board
      - Driven by laggard firms
   c. Firms that professionalize report 30% ↑ firm productivity

3. **Quantitative Framework:** How much does the within-firm response matter in the aggregate?

Foreign Competition Induces Family Firms to Professionalize

1. **First-time access to confidential admin data** on 6M company executives in India
   - Family ties and tenure histories of executives and directors
   - Identify family-managed firms: the predominant organizational form in developing countries
     (La Porta et al., 1999; Bertrand & Schoar, 2006)

2. **Natural Experiment:** large, product-specific import competition shock → event-study design
   a. Firms contract: 28% ↓ in firm revenues
   b. Family firms professionalize management: 15% ↓ share of family executives on the board
      - Driven by laggard firms
   c. Firms that professionalize report 30% ↑ firm productivity

3. **Quantitative Framework:** How much does the within-firm response matter in the aggregate?
   - Competition compels low productivity firms to professionalize to avoid exit
   - Impact on aggregate productivity and welfare is ambiguous in theory:
     a. Professionalizing firms become more productive
     b. Saving laggards weakens selection
     c. Saving laggards preserves domestic variety

Contribution to the Literature

- **Competition and Firm Productivity:** Hicks (1935); Leibenstein (1966); Nalebuff and Stiglitz (1983); Hart (1983); Schmidt (1997); Raith (2003); Nickell (1996); Schmitz (2005); Holmes & Schmitz (2010); Backus (2020)

→ Open the black box of *"X-inefficiency"*: managerial upgrading

- **Managerial Practices:** Bloom and Van Reenen (2007); Bloom et al. (2012, 2013)

→ Why do poor managerial practices persist despite high returns? Can competition lead to better management?

- **Pro-competitive Gains From Trade:**
  Across-firm resource reallocation: Melitz (2003); ACR (2012); Edmond et al. (2014); Arkolakis et al. (2019)
  Within-firm productivity gains: Caliendo and Rossi-Hansberg (2012); Caliendo et al. (2015, 2020); Bustos (2011); Akcigit Melitz (2022); Bloom et al. (2016); Topalova Khandelwal (2011); Amiti and Konings (2007); Bernard et al. (2011); Dhingra (2013) Atkin Khandelwal (2017); Alfaro-Urena et al. (2022) Autor et al. (2020); Chen Steinwender (2021)

→ Organizational channel (talent of managers) of within-firm productivity gains from trade

- **Family Firms:** Bertrand Schoar (2006); Burkart et al. (2003); Bennedsen et al. (2007); Pérez-González (2006); Villalonga Amit (2007), Bertrand et al. (2008); Caselli Gennaioli (2013); Bandiera et al. (2018); Lemos Scur (2018); Akcigit et al. (2021)

→ Response of family firms to globalization

Removal of Quantitative Restrictions (QRs): Large, Product-Specific Trade Shock

1950s- India used **Quantitative Restrictions (QRs)** to protect domestic firms

1990s: First-generation reforms in 1991 removed some QRs; many remained

- 3000 HS 8-digit products, almost 30% of all tariff lines
- Mostly final consumer goods
- QRs continued by exploiting GATT Article XVIII:B (QRs on weak BoP grounds)

Removal of Quantitative Restrictions (QRs): Large, Product-Specific Trade Shock

1950s- India used **Quantitative Restrictions (QRs)** to protect domestic firms

1990s: First-generation reforms in 1991 removed some QRs; many remained

- 3000 HS 8-digit products, almost 30% of all tariff lines
- Mostly final consumer goods
- QRs continued by exploiting GATT Article XVIII:B (QRs on weak BoP grounds)

1997: Second-generation WTO-imposed reforms: removal of all remaining QRs

- After complaints to WTO by the US and EU

2000s: Imports of liberalized products soared after the reform. No impact on exports.

Indian Response | HS Product Code Example | Media Coverage | Empirical Strategy | Timeline and Scope | Impact on Trade

Unusually Narrow Scope of India's Second-Generation Trade Reforms

- Variation in import competition across the product space and time
- Externally imposed: hinged on IMF technical assessment of India's BoP
- Unlike first-gen reforms, no concurrent domestic deregulation → isolate trade reform impact
- No change in export policy → isolate import competition impact
- Affected mostly consumer goods: limited impact on firms' input costs

HS Product Code Example

Conclusion

- Trade drives aggregate growth by improving laggard firms' productivity
- Empirical lens here is family firms, the mechanism is more general
- Protection from competition can sustain taste-based deviations from merit (Becker 1957)
  - along multiple dimensions: kinship, caste, religion, race, or gender
- Competition may help restore meritocracy
- These organizational changes occur without deeper institutional shifts

Thank you!

Indian Response to WTO's QR Ruling

"The commerce secretary had written to me to say that they intended to make a case for continuing with QRs on consumer goods for BoP reasons, and he wanted confirmation of support from the Ministry of Finance. I promptly wrote back to say that ***it would be against our national interest because it painted a picture of helplessness that was completely contrary to what we in the Ministry of Finance were projecting to foreign investors****"*

—Montek Singh Ahluwalia, Former Indian Finance Secretary and Deputy Chairman of the Planning Commission

Policy response by India:

- Tariffs maintained : limited room to raise beyond WTO bindings
- Canalization of Grains
- "War Room" & sensitive list: DGFT monitored ~300 consumer goods
- Some anti-dumping (esp. chemicals, steel, consumer goods)

Removal of quantitative restrictions on all imports to transform Indian market

Removal of quantitative restrictions on all imports will transform the Indian market like never before.

PROFUSION OF CHOICE: Shelves like these in a Chennai super store are getting stacked with an array of foreign products

Amma Naana Super Store, TTK Road, Chennai: Heinz spaghetti with sausages in tomato sauce, 220 g for Rs 155; H-Vollmilch low-fat milk with one-year shelf life,1 litre for Rs 66; Sugar-free chocolate biscuits, 184 g for Rs 98...

Rustom Stores, Colaba, Mumbai: Blue Bunnyice cream, 1.5 litre for Rs 425; St Martin's iced tea, 240 ml for Rs 25; Langnese honey, 500 g for Rs 165

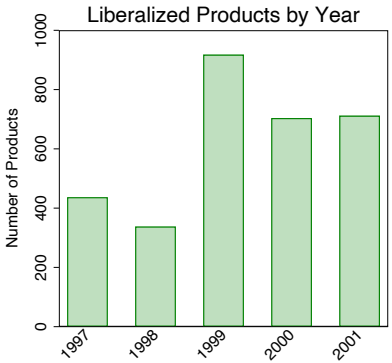

Steak House, Jor Bagh, Delhi: Lake land mayonnaise, 450 g for Rs 98; Laughing Cow cheese, 180 g for Rs 45...

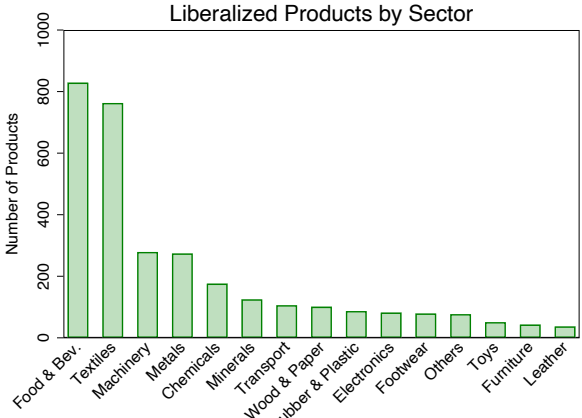

A sample of goodies on the shelves of stores in the three metros on April 3, two days after India abolished all quantitative restrictions (QRs) on imports. On payment of customs duty, anybody can now import any amount of any product. A freedom of economic choice that comes a full 54 years after the freedom of political choice the country attained in 1947.

Exit (in the Long Run)

- Cannot confirm exit status or exit year in Prowess data
- Verify exit status by matching firms that drop out of Prowess to MCA admin data
- Long-difference: measure whether firm exits in any year from 2001–2021

Back Model vs Data

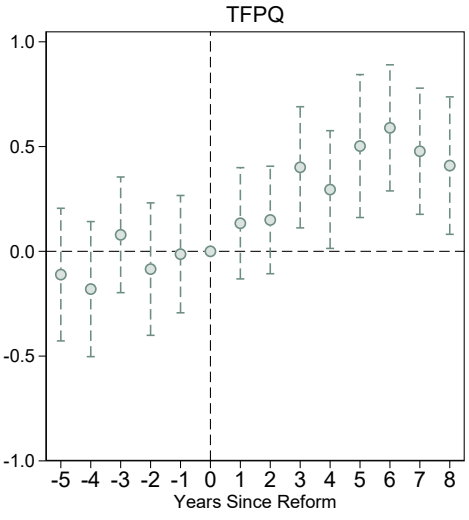

❸ Firms that Professionalize Report Higher Product Concentration

Note: A family firm is defined as having professionalized if its share of family top managers was lower in $t = 8$ as compared to $t = 0$.

Selection Into Professionalizing Management

Back

Preferences

- Representative consumer

$$\mathcal{U} = X^{1-\alpha} Y^{\alpha} \qquad (0 < \alpha < 1)$$

  - X: freely-traded homogeneous good, with unit labor requirement
  - Y is a CES aggregate of differentiated varieties with elasticity of substitution $\sigma > 1$
- The mass of foreign varieties is M_F
- Consumers spend share α of total expenditure E on good Y
- Demand for each variety y is given by $y = \alpha E P^{\sigma-1} p^{-\sigma}$

Technology

- Firms differ in productivity z and produce differentiated varieties using labor ℓ.
- Constant marginal cost with a fixed overhead cost: $\ell(z) = f + \frac{y}{z}$
- Prices are a markup over marginal cost: $p(z) = \frac{\sigma}{\sigma-1} \cdot \frac{w}{z}$
- Profits: $\pi(z) = Az^{\sigma-1} - wf$ $\left(\text{where } A = \frac{1}{\sigma}\left(\frac{\sigma-1}{\sigma}\right)^{\sigma-1} EP^{\sigma-1}w^{1-\sigma} = \text{market demand}\right)$

Infosys CEO resigns after long-running feud with founders

By **Samantha Kareen Nair** and **Sankalp Phartiyal**

August 18, 2017 3:58 PM GMT+1 · Updated 8 years ago

Aa

BENGALURU/MUMBAI (Reuters) - Vishal Sikka, the chief executive brought in to turn around India's Infosys three years ago, resigned on Friday, blaming a "continuous drumbeat of distractions" and a long-running row with the founders over company strategy.

Sikka's resignation spooked investors in India's second-biggest IT services company and sent its shares down nearly 10 percent, wiping $3.45 billion off its market value. The stock touched its lowest level since the start of Sikka's tenure.

Model: Management Choice | Model: Comparative Statics | Profits After Trade

Profits After Trade Liberalization ($t = 1$)

- Switching from professional to family management incurs (reputational) cost κ Example

$$\text{Payoff}\,(z, \mathcal{P}_0, \mathcal{P}_1) = \mathcal{P}_1 \pi(\gamma z) + (1 - \mathcal{P}_1)\left[\pi(z) + B - \kappa \mathcal{P}_0\right]$$

- When $\mathcal{P}_1 = 1$ (the firm upgrades management in $t = 1$), the payoff is $\pi(\gamma z)$ regardless of the past choice
- When $\mathcal{P}_1 = 0$ (the firm is family-managed in $t = 1$), the payoff is:
  - $\pi(z) + B$ if it was family in $t = 0$ (i.e., $\mathcal{P}_0 = 0$)
  - $\pi(z) + B - \kappa$ if it was professionally-managed in $t = 0$ (i.e., $\mathcal{P}_0 = 1$)

Model: Baseline Equilibrium | Model: Comparative Statics | Model: Management Choice

Equilibrium: Free Entry, Exit, and Equilibrium Price Index

- **Free entry:**

$$[1 - G(z_e)] \cdot \frac{1}{\delta}\pi - f_E = 0$$

- **Average profits among surviving firms:**

$$\pi = \frac{\sigma - 1}{k - \sigma + 1} f \cdot \Delta, \qquad \Delta \equiv 1 + \frac{k}{\sigma - 1}\left(\gamma^{\sigma-1} - 1\right)\gamma^{-k}\left(\left(\frac{\mathcal{B}}{f\left(\gamma^{\sigma-1} - 1\right)}\right)^{\frac{\sigma-k-1}{\sigma-1}} - 1\right)$$

- **Exit cutoff:**

$$z_e = \left(\frac{1}{\delta f_E} \cdot \frac{\sigma - 1}{k - \sigma + 1} f\Delta\right)^{1/k}$$

- **Price index (domestic varieties):**

$$P = \frac{1}{\rho\gamma}\left(\sigma f_E\right)^{\frac{1}{\sigma-1}}\left(\frac{\sigma - 1}{k - \sigma + 1} \cdot \frac{f}{\delta f_E} \cdot \Delta\right)^{-1/k}, \qquad \rho \equiv \frac{\sigma - 1}{\sigma}$$

Back

Equilibrium: Market Clearing and Aggregates

- **Masses of firms.** Let M_E be the mass of entrants and M the mass of active firms:

$$M = \frac{1 - G(z_e)}{\delta} M_E$$

- **Labor demand in differentiated sector.** With revenue R and aggregate operating profits Π:

$$L_Y = \frac{R - \Pi}{w} + M_E f_E$$

  Free entry implies $\Pi = w M_E f_E$

- **Goods-market clearing.** Revenue equals expenditure on differentiated goods:

$$R = E, \qquad E = \alpha I$$

- **Numeraire and income.** Homogeneous good pins down $w = 1$ and total income is the wage bill:

$$I = wL = L \quad \Rightarrow \quad E = \alpha L, \;\; L_Y = \alpha L, \;\; L_X = (1 - \alpha) L$$

Back

Import Competition: Fall in Aggregate Demand

- Model import competition as an exogenous increase in foreign varieties M_F

$\Longrightarrow$ Lowers the price index

$$P = \left[M_H \int_{z_e}^{\infty} p(z)^{1-\sigma} \frac{g(z)}{[1 - G(z_e)]} dz + M_F \uparrow \int_{z_F}^{\infty} p_F(z)^{1-\sigma} \frac{g(z)}{[1 - G(z_F)]} dz \right]^{1/(1-\sigma)}$$

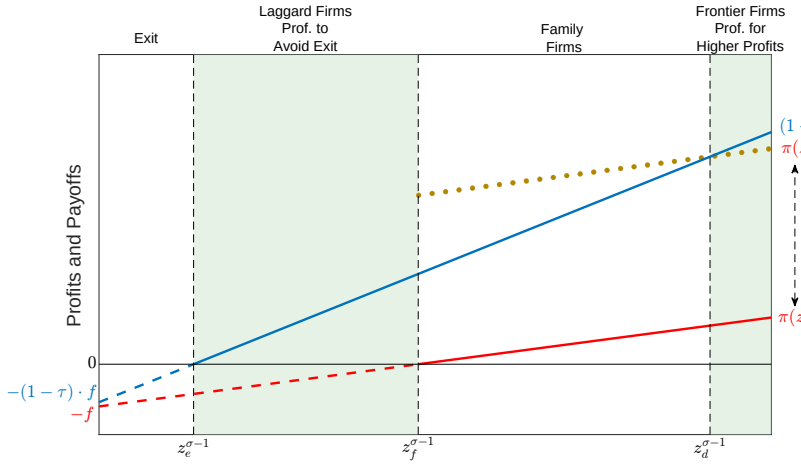

$\Longrightarrow$ Lower aggregate demand for Indian varieties $A = \frac{1}{\sigma} \left(\frac{\sigma - 1}{\sigma} \right)^{\sigma - 1} E P^{\sigma - 1} w^{1-\sigma}$

$\Longrightarrow$ Reduces profits for all domestic firms

$\Longrightarrow$ Thresholds (z_e, z_f, z_d) shift up (more exit, more professionalization)

Back

Contracting Frictions

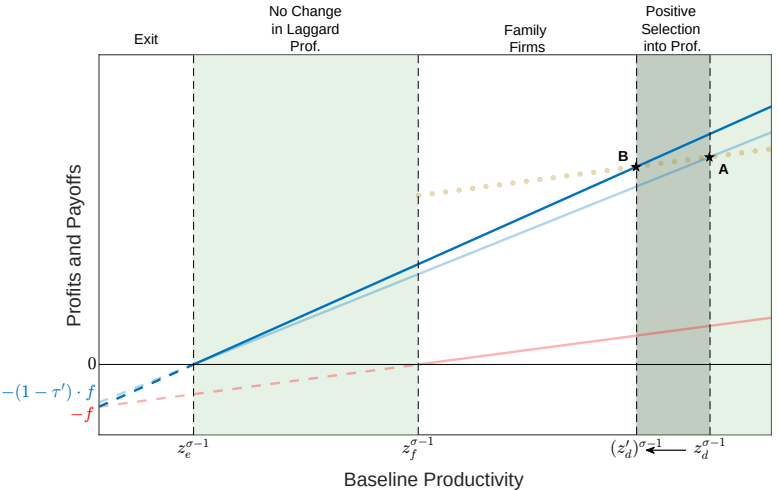

Productivity Thresholds:

- $z_f = \left(\frac{f}{A}\right)^{\frac{1}{\sigma-1}}$
- $z_e = \frac{1}{\gamma}\cdot z_f$
- $z_d = \left(\frac{\mathcal{B}-\tau f}{f\left((1-\tau)\gamma^{\sigma-1}-1\right)}\right)^{\frac{1}{\sigma-1}}\cdot z_f$

Note: Baseline productivity: before decision to professionalize.

Model: Baseline Equilibrium | Model: Comparative Statics

Contracting Frictions

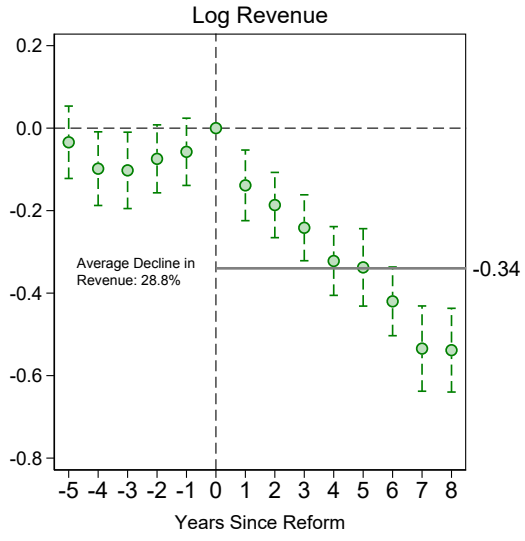

Productivity Thresholds:

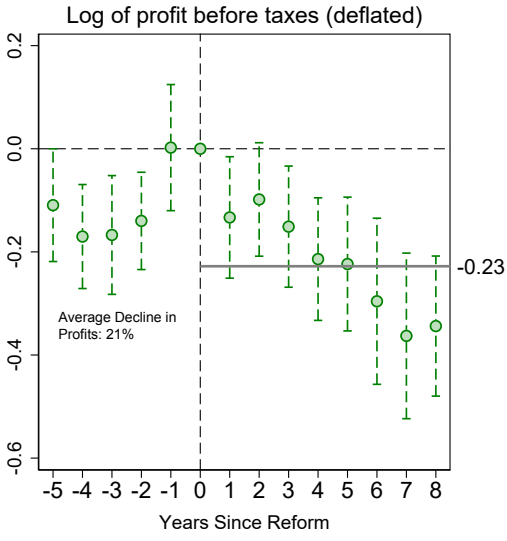

- $z_f = \left(\frac{f}{A}\right)^{\frac{1}{\sigma-1}}$
- $z_e = \frac{1}{\gamma}\cdot z_f$
- $z_d = \left(\frac{\mathcal{B}-\tau f}{f((1-\tau)\gamma^{\sigma-1}-1)}\right)^{\frac{1}{\sigma-1}}\cdot z_f$

Note: Baseline productivity: before decision to professionalize.

Calibrating the Pareto Tail (k)

- **Sample.** Rank firms by revenue, keep 95th–99th pct.
- **Transform.** F_i = empirical CDF $\Rightarrow$ $z_i = -\ln(1 - F_i)$ (linearizes a Pareto tail).
- **QQ-regression.** $\ln x_i = \alpha + \underbrace{\beta}_{=(\sigma-1)/k} z_i + \varepsilon_i.$
- **Result.** $\hat{\beta} = 0.87 \quad \Rightarrow \quad \hat{k} = \dfrac{\sigma - 1}{\hat{\beta}} = \dfrac{3}{0.87} \approx \mathbf{3.5}.$
- **Robustness.** Cut-offs from 95th to 99th give $k \in [3.4,\ 3.6]$ ✓

QQ-plot of $\ln x_i$ (log revenue) against $z_i = -\ln\left(1 - F_i\right)$ for the top 5% of firms

Back

Analytical Moment Conditions for $\mathcal{B}, \gamma$

- Log mean revenue gap (professional minus family firms): $(\sigma - 1)\log\gamma + \log\left[\frac{\gamma^{-(\sigma-k-1)} - 1 + \delta^{\sigma-k-1}}{\gamma^{k} - 1 + \delta^{-k}} \cdot \frac{1-\delta^{-k}}{1-\delta^{\sigma-k-1}}\right]$
- Share of family-managed firms: $\gamma^{-k}\left(1 - \delta^{-k}\right)$

where $\delta = \left[\frac{B}{f(\gamma^{\sigma-1}-1)}\right]^{1/(\sigma-1)}$

Back

Aggregate Productivity and Welfare

- **Aggregate productivity**,

$$AP = \left[\int_1^{\infty} \tilde{z}^{\sigma-1} \mu(z) dz \right]^{\frac{1}{\sigma-1}},$$

where μ is the productivity distribution among active firms, and $\tilde{z}$ is realized productivity

- **Change in consumption welfare**

$$\frac{W_1^C}{W_0^C} - 1 = \left(\frac{P_0}{P_1} \right)^{\alpha} - 1,$$

where P_t is the price index for differentiated goods, and α is the expenditure share on differentiated goods

- **Change in welfare including private benefits**

$$\frac{\mathcal{W}_1}{\mathcal{W}_0} - 1 = \frac{\mathcal{I} + \mathcal{B} M_{\text{fam},1}}{\mathcal{I} + \mathcal{B} M_{\text{fam},0}} \left(\frac{P_0}{P_1} \right)^{\alpha} - 1,$$

where $\mathcal{I}_t$ is aggregate disposable monetary income, $\mathcal{B}$ is the per-firm nonpecuniary benefit of family management and $M_{\text{fam},t}$ is the mass of active family firms in period t
